# Streaming model (one-pass)

---

- Stream.
  - Elements  $a_1, a_2, \dots, a_m$  from the universe  $[n] = \{1, 2, \dots, n\}$ .
  - Elements arrive one by one.
  - Must process element  $a_i$  before we see  $a_{i+1}$ .

- Space. Measured in bits.
- Goal. Small space (sublinear/polylogarithmic).
- Example. What can we do in  $O(\log n + \log m)$  space?

# Frequent elements

# Frequent elements

---

- **Heavy Hitters Problem.** Find all elements  $i$  that occurs more than  $m/k$  times for some fixed  $k$ .
- **Example.** Return all elements that occur more than  $21/3$  times = 7.

4	4	1	2	4	4	3	1	1	2	5	9	7	4	1	3	4	1	4	4	1
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

- **Bad news.** Need  $\Omega(n)$  space for one-pass algorithm.
- **Good news.**
  - Can estimate the frequency.
  - Can do better if we allow one-sided error:
    - Output all elements that occur more than  $m/k$  times.
    - Might also output other elements.

# Frequent elements

---

- **Example.**  $k = 3$ .

counter 1: 4, 2

counter 2: 1, 1

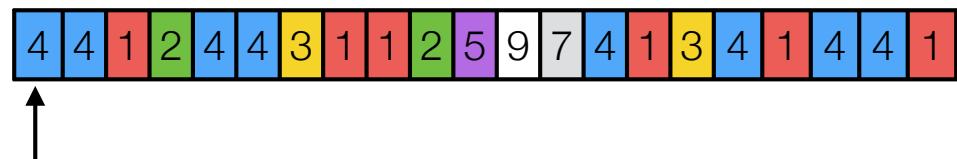

- **Space.**  $O(k \cdot (\log n + \log m))$ .

Keep  $k-1$  counters in an associative array  $A$ .  
**while** (stream is not empty) **do**  
    **If**  $j \in \text{keys}(A)$  **then**  
         $A[j] \leftarrow A[j] + 1$   
    **else if**  $|\text{keys}(A)| < k - 1$  **then**  
         $A[j] \leftarrow 1$   
    **else**  
        Decrement all counters by 1.  
        Remove all elements with counter 0.  
    Output all elements in  $\text{keys}(A)$

# Misra-Gries Analysis

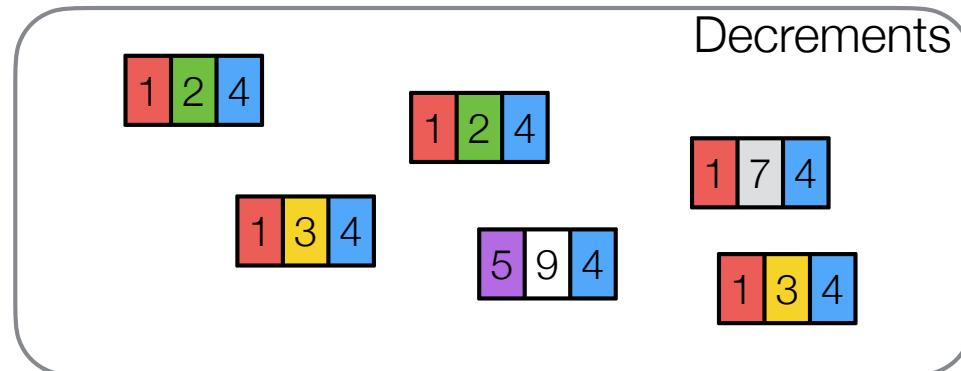

- **Lemma.** Any item with frequency more than  $m/k$  is in  $A$  by the end of the algorithm.
- **Lemma.** Let  $\hat{f}_i$  be the estimate of the frequency of element  $i$ . Then

$$f_i - \frac{m}{k} \leq \hat{f}_i \leq f_i .$$

counter 1: , 2

counter 2: , 1

# Reservoir Sampling

# Reservoir Sampling

---

- **Algorithm.**

```
put the first  $k$  elements into a “reservoir”  $R = \{r_1, r_2, \dots, r_k\}$ .  
for  $i > k$  until the stream is empty do  
    with probability  $k/i$  replace a random entry of  $R$  with  $a_i$   
Return  $R$ .
```

- **Claim.** For all  $t \geq i$ ,  $P[a_i \in R_t] = k/t$  , where  $R_t$  denotes the reservoir after time t.
- **Proof.** Consider element  $a_i$ .
  - $P[a_i \text{ chosen at time } i] = k/i$  .
  - $P[a_i \text{ replaced at time } j] = (k/j) \cdot (1/k) = 1/j$  .
  - $P[a_i \text{ not replaced at time } j] = 1 - 1/j = (j - 1)/j$  .
  - Thus

$$P[a_i \in R_t] = \frac{k}{i} \cdot \frac{i}{i+1} \cdot \frac{i+1}{i+2} \cdots \frac{t-1}{t} = \frac{k}{t} .$$
